

Welcome to bioBakery

bioBakery is a virtual machine (VM) environment designed to help you execute metagenomics analyses.

bioBakery and the tools therein were developed by the Huttenhower lab at the Harvard School of Public Health:

[HTTP://HUTTENHOWER.SPH.HARVARD.EDU/](http://huttenhower.sph.harvard.edu/)

bioBakery is based on Ubuntu linux version 12.10.

Using bioBakery tools

This document introduces some important details of the **bioBakery** environment.

For an overview of the types of software and analyses available in **bioBakery**, please visit:

[HTTPS://BITBUCKET.ORG/BIOBAKERY/BIOBAKERY](https://bitbucket.org/bioBakery/bioBakery)

For help with a specific tool, please visit its individual web site; links to individual tool pages are available here:

[HTTP://HUTTENHOWER.SPH.HARVARD.EDU/RESEARCH](http://huttenhower.sph.harvard.edu/research)

Differences from standard linux (1)

We have customized **bioBakery** to be a bit more forgiving than the typical linux environment.

In linux, typing **rm** *file* in the terminal will permanently delete the file; in **bioBakery**, this command moves the file to the trash. (Use **hardrm** *file* to delete permanently.)

bioBakery will also prompt you before overwriting a file. (E.g. if you attempt to move or copy a file to a location with an identically named file.)

Differences from standard linux (2)

You can open a file in **bioBakery** by typing **open** *file* in the terminal; this will open the file in its associated default program.

Right clicking on the Desktop, a folder icon, or inside of a folder will give you the option to open a terminal at that location. (Select “open terminal here”)

Sharing files with bioBakery (1)

Using Vagrant and VirtualBox, your computer's operating system (the "host OS") runs **bioBakery** within a window as a separate operating system (the "guest OS").

By default, the guest OS can only see files on the host OS if they are located within the host's vagrant folder.

The vagrant folder appears in **bioBakery** as `/vagrant`; a shortcut to this folder appears on the **bioBakery** Desktop.

Sharing files with bioBakery (2)

We strongly recommend saving important files to the host OS so they are available outside of **bioBakery**.

You may also be interested to share additional data folders from your host OS with **bioBakery**.

PATH details

All programs installed by **biobakery** are located in
`/usr/share/biobakery`

Executable programs located in this folder have been
added to the PATH environment variable.

This means that you can type a command like
`$ python metaphlan.py --help`
from anywhere to see MetaPhlAn's help output.

Additional software

In addition to packaging Huttenhower lab tools, **bioBakery** contains all of the freely-distributable dependencies of those tools (e.g. bowtie2).

Some additional dependencies (e.g. USEARCH) cannot be distributed directly with **bioBakery**, but are free to add if the user wishes.

[CLICK HERE TO LEARN HOW](#)

Adding/upgrading programs

To add or upgrade a Huttenhower Lab tool run:

```
$ sudo apt-get install hutlab_tool
```

The same command can be used to install other linux utilities (unsupported):

```
$ sudo apt-get install other_utility
```

For more help

Check out the **bioBakery** wiki for more information:
